

Your First Blog

Assignment: Create a simple blog homepage using HTML (index.html) and decorate it using CSS (style.css). You will be expanding on this website for future assignments.

1. **Choose a Subject:** Select a topic that interests you or that you are passionate about. This will be the theme of your blog.
2. **Create the Homepage (index.html):**
 - Use HTML to structure your homepage.
 - Include the following elements:
 - **<header>**: The header section with a catchy title and a brief description of your chosen subject. This might include the name of your blog inside an **<h1>** tag and a brief description inside of a **<p>** tag.
 - **<nav>**: A navigation bar with links to "Home," "About," "Blog," and "Contact" pages. These links don't have to be functional yet. You may want to use an unlinked list for this.
 - **<main>**: The main content area where you will add articles and posts.
 - **<article>**: Create at least two articles within your **<main>** tag related to your subject. Each article should have a title, content, and an optional image.
 - **<footer>**: Include a footer at the bottom with a copyright notice.

3. Apply Styling (style.css):

- Use CSS (Cascading Style Sheets) to style your homepage and make it visually appealing.
- Customize fonts, colors, margins, padding, and other CSS properties to enhance the look and feel of your blog.

4. Testing:

- Make sure that everything looks the way you want it to.
- Test your blog homepage in various web browsers to make sure it's compatible.

5. Submission:

- Share your finished homepage with the tech coach and show it off to two other students.
